

# Multi Site (1 to Many) Issue

- The issue originated during Market Opening with the original set up of 'Multi sites' e.g. commercial retail blocks and apartment blocks
- The practice was discontinued several years ago and there is currently a 1:1 relationship only when sites are set up
- A single SAP 'Connection Object' was set up for the building with multiple MPRNs associated with it
- The problem is that if an address is changed on one it goes to all the associated MPRNs via multiple market messages
- This issue has been discussed at previous IGG meetings but was raised again recently by SSE Airtricity
- ESNB can confirm the following:
  - 3,297 CO/Buildings are associated with 50,597 MPRNs
  - 2,303 CO/Buildings are associated with 32,897 real MPRNs i.e. Energised
  - ESNB have sent each supplier the list of their 'multisite' MPRNs this week
- Before the end of 2015 ESNB will process the connection objects and MPRNs to:
  - Ensure that the old, created COs are never made live
  - Break the links between multiple COs & MPRNs where all the data is available on the system
- Site visits will be required for 327 locations to verify data, these 669 MPRNs will take longer to sort
